

GIM Nextgen Product Catalogue

Instrumentation, gateways, and engineering support for geotechnical and structural monitoring.

GIM Nextgen helps project teams deploy reliable monitoring systems across tunnels, dams, rail corridors, construction sites, and critical infrastructure. This catalogue reflects the current website content and summarizes our product families, service scope, and typical deployment environments.

Why teams choose GIM Nextgen

- Engineering-grade hardware designed for harsh civil and mining environments.
- Integrated remote monitoring from field sensor to cloud dashboard.
- Global support network with delivery, commissioning, and lifecycle support.
- Practical solutions focused on risk reduction and faster decision-making.

Product portfolio overview

Category	Focus
Connectivity & Gateways	Edge communications for sensor networks and remote visibility.
Tilt & Inclinometer Systems	Angle, alignment, slope, and excavation movement monitoring.
Strain & Load Monitoring	Stress, strain, and load measurement in critical assets.
Displacement & Settlement	Movement tracking for cracks, joints, and settlement points.
Vibration & Environmental	Dynamic sensing for vibration, acceleration, and site conditions.
Survey Targets & Markers	Reference points for deformation and structural movement surveys.

Core capabilities

- Real-time monitoring with early warning visibility on critical assets.
- Custom instrumentation and housings for demanding operating conditions.
- Engineering survey support for structural health and ground movement programs.
- Cloud-ready connectivity using LoRaWAN, LTE, Wi-Fi, and other project-specific backhaul options.

Featured solution areas

- Communication nodes for digitizing legacy analog sensors and transmitting readings remotely.
- LoRaWAN gateways that act as the site backbone for large distributed monitoring networks.
- Wireless and portable tilt systems for slopes, dams, buildings, and excavation works.
- In-place inclinometers, casings, and readout systems for long-term displacement monitoring.

Services that support deployment

- Site surveys and geotechnical assessments to guide instrument selection.
- System integration, commissioning, and control-room connectivity.
- Remote monitoring, analytics support, and long-term maintenance planning.
- Training and project handover for field teams and stakeholders.

Typical projects

- Metro and rail corridors requiring alignment, settlement, and vibration monitoring.
- Tunnel excavation programs that need convergence and deformation tracking.
- Dam safety projects with seepage, pressure, and movement instrumentation.
- Construction risk management during piling, excavation, and structural staging.
