

Real-time Monitoring Platform

A connected ecosystem for collecting, transmitting, visualizing, and acting on field data.

The GIM Nextgen monitoring platform combines rugged field instruments, reliable communications, and cloud dashboards so teams can interpret site conditions quickly and respond before small issues escalate.

Platform stack

Category	Focus
Sensors & Devices	Field instrumentation for tilt, strain, displacement, pressure, and environment.
Gateways & Comms	LoRaWAN, cellular, Wi-Fi, and redundant paths for dependable transport.
Cloud Dashboard	Remote visualization, alert review, trend analysis, and reporting.
Project Workflow	Installation, threshold setup, operator training, and ongoing support.

What the platform enables

- 24/7 visibility into instrumentation data from distributed sites.
- Threshold-based alarms and event notifications for faster intervention.
- Trend analysis and reporting to support compliance and stakeholder reviews.
- Remote access for project, safety, and operations teams across locations.

Field-to-dashboard workflow

- Sensors capture changes in movement, load, vibration, or environmental conditions.
- Edge devices buffer readings and package them for secure transmission.
- Gateways forward site data to the cloud using the best available backhaul.
- Dashboards surface alarms, history, and exportable reports for decision-makers.

Operational benefits

- Early warnings reduce the likelihood of unplanned failures and emergency response.
- Unified visibility simplifies communication between contractors, consultants, and owners.
- Cloud reporting shortens the path from measurement collection to compliance-ready outputs.
- Scalable architecture supports both temporary construction monitoring and long-term asset programs.

Support and delivery model

- Turnkey commissioning from procurement through final handover.
- Threshold planning and dashboard configuration aligned to project risk criteria.
- Training for field staff on sensor handling, interpretation, and maintenance.
- Ongoing support for diagnostics, analytics, and network health monitoring.

Best-fit applications

- Tunnel, excavation, and retaining-wall deformation programs.
- Dam safety and pore-pressure monitoring networks.
- Rail and metro corridors with settlement, cant, and vibration requirements.
- Construction sites that need centralized risk monitoring across multiple work fronts.
