

Dynamic Displacement Sensor

Displacement & Settlement Monitoring | Product brochure

Dynamic Displacement Sensor

Event-based wireless displacement sensor that records structural movement when thresholds are exceeded.

Key benefits

- Wireless battery-powered monitoring
- Records events around threshold breaches
- Sends data efficiently over LoRaWAN

Engineering highlights

Event capture: Records time windows around significant displacement events.

Remote transmission: Low-power data delivery over wireless networks.

Targeted monitoring: Ideal for dynamic structural movement measurement.

Typical applications

- Crack development tracking
- Dynamic settlement
- Tunnel displacement monitoring

Technical specifications

Specification	Value
---------------	-------

Operation	Event-triggered displacement recording
Communication	LoRaWAN
Power	Battery powered
